Integrated Power Services introduces Dodge TXT advanced exchange & remanufacturing program

Units remanufactured to original OEM design specifications with genuine Dodge® renewal parts and backed by full one year warranty

GREENVILLE, SC — Integrated Power Services (IPS), a national leader in the service and repair of electric motors and mechanical power transmission components, has introduced its exclusive Dodge TXT Advanced Exchange & Remanufacture Program. The service is an important complement to the company's ability to repair aggregate and cement application motors of all sizes — from NEMA frames to large, medium and high voltage motors.

The program offers the quick turn time operators need to replace repairable failed units, as IPS can ship remanufactured TXTs from all 16 regional service centers (the company's Birmingham, Washington, Pennsylvania and Denver locations also serve as TXT exchange unit storage facilities). Failed units are returned to IPS as part of exchange (customers must return failed units within 15 days to receive a credit for their core deposit).

IPS has ready-to-ship remanufactured inventory in TXT sizes 1 to 10 and offers Level I and Level II repair kits for TXT units. Level I repair kits include input/output seals, bearing sets, a shim kit and instruction manual. Level II repair kits offer the same components of a Level I kit and include an input pinion and first stage gear. IPS also carries output shaft hubs and carcasses in our inventory.

According to John Covington, IPS senior vice president of Marketing, IPS doesn't use knock-off parts, which he describes as a common practice in the industry. "We have contractual access to Dodge TXT drawings, specifications and procedures, and rebuild all remanufactured units to original specifications," he said. "We use genuine Dodge renewal parts and back our work with a full one year warranty."

"The Dodge TXT Advanced Exchange & Remanufacture is another "speed to market" advantage we offer to IPS customers. We have more ways to deliver reliability faster, whether that means repairs, reconditioning or replacement. It's a clear advantage when you measure downtime in dollars."

Headquartered in Greenville, SC, IPS is a national leader in the service and repair of electric motors and mechanical power transmission components, with over 2,000 customers across a range of capital-intensive industries. IPS has sixteen regional service centers across the U.S., offering industry specific experience, deep technical resources and capabilities, and 24/7 dependability on a local, regional and national basis. As an independent power services company, IPS also offers replacement sales and installation services for OEMs. Additional information is available online at www.integratedps.com.
